LOCOMOTIVE COFFEE MACHINE.

- A. Boiler.
- B. Coffee recipient.
- C. Sugar basin.
- D. Whistle.
- E. Tubular water recipient.
- F. Glass tube siphon.
- G. Filter.
- H. Lamp.
- I. Cock.

Instructions.

Pour the water through the tube E and the coffee through the chimney in the proportion of 10 grammes for coffee to each cup of 100 grammes of water - light up the lamp H leaving open the whistle D.

After a few minutes the water will boil and you perceive the steam coming out of the whistle D which makes it whistle. Shut it up. At the same time you perceive the water, which rapidly ascending the glass tube F, and passing through the filter G, takes coffee's aroma.

As soon as the water has passed through the glass tube into the hole B G the lamp extinguishes itself, which occasions the coffee to come back into the boiler A. If you want good strong coffee light the lamp again and repeat the process after which pour the coffee in the cup through the cock I.
